## Figures of merit for an injector:

- small emittance
- high current

→ high ratio current / emittance  $\approx$  Brilliance

BILD FRANKFURT \* 5. OKTOBER 2010

Blick ins Innere eines Beschleunigers

## Hier wird der Urknall erforscht

FAIR\*1

Darmstadt - Was geschah eine Tausendstelskunde nach dem Urknall? Wie wurde die Welt eine brodelnde Ursuppe, sind verschiedene Arten von Materie aufgebaut, z. B. die unerforschte dunkle Materie? Das soll ein neues Forschungszentrum in Darmstadt klären. Gestern unterschrieben 9 Staaten aus Asien, Ost- und Westeuropa den Vertrag über Bau und Betrieb. Startschuss für den Teilchenbeschleuniger

Das Ding funktioniert wie eine Kanone, ist nur viel größer (120 Meter lang, 2 Meter Durchmesser). Da werden kleine Atome mit hohen Spannungen beschleunigt in einen Ring geschleudert, auf andere Materialien geschossen. Durch die Aufprallwucht werden sie zertrümmert, können untersucht werden: „Im Universum steckt noch viel unbekanntes Zeug“, sagt Ingo Peter, Sprecher des Helmholtzentrums für Schwerionenforschung, auf dessen Gelände das Mega-Projekt entsteht. „FAIR“ baut auf eine bestehende Anlage auf, kann immer weiter ausgebaut werden: 1,2 Mrd Euro kostet es. „Hessen hat sich als Standort bereit erklärt, 94 Mio Euro in den Bau zu investieren“, so Hessens MP Volker Bouffier (CDU). 178 Mio steuert Russland bei. 3000 Forscher in 40 Ländern tüfteln an der Anlage. Der eigentliche Tiefbau beginnt aber erst im Winter 2011/12. Jak

Das 3-D-Modell der geplanten Anlage mit Beschleuniger Ring. Sie soll ab 2017 Ionenstrahlen liefern

(\* englisch für Facility for Antiproton and Ion Research in Europe, dt.: Anlage für Antiprotonen- und Ionenforschung)

## Brilliance Definition:

$$B_{x/y} := (q/A) * \text{Current} / \text{Emittance}_{x/y}$$

- achieved hor. & ver. UNILAC brilliances are similar
- **horizontally we are not ok**
- **vertically we are ok**

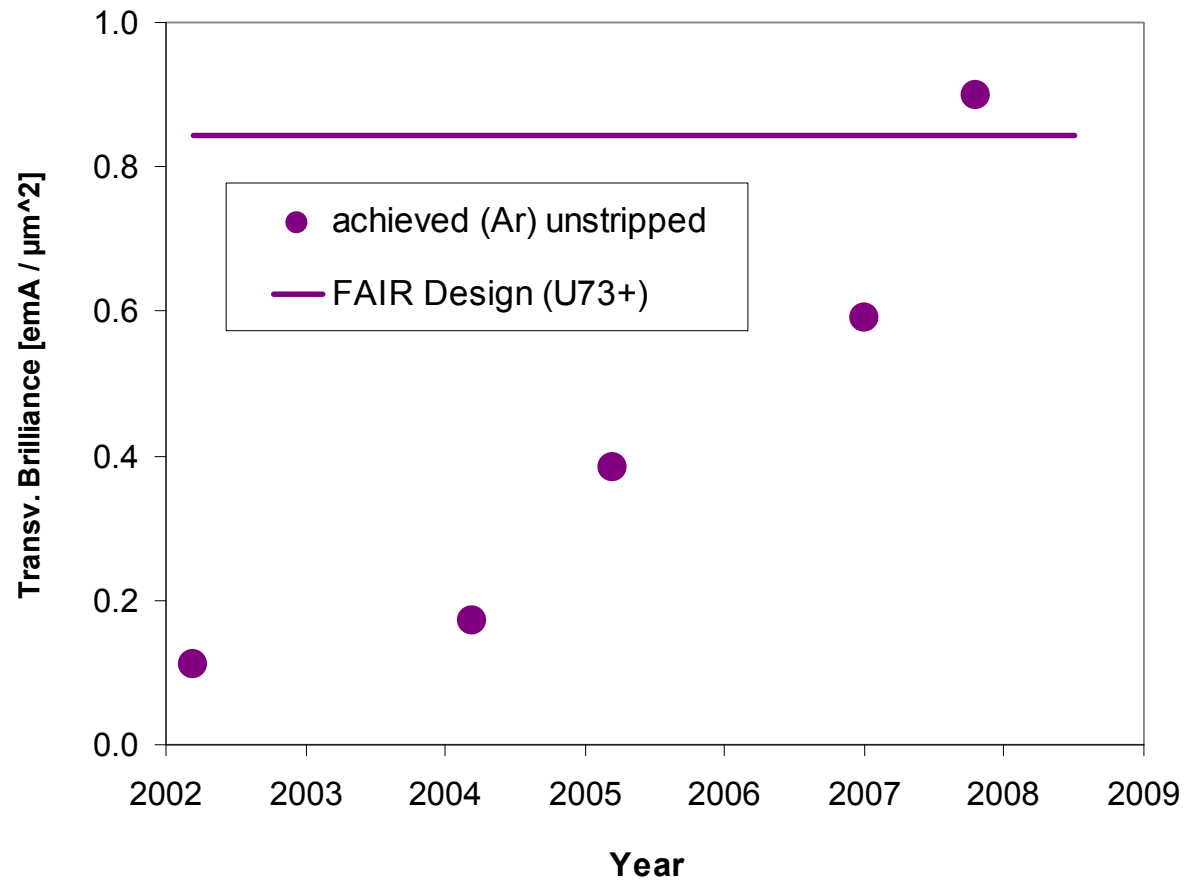

- Horizontal and vertical brilliances are defined separately
  - $B_x = (q/A) * I / E_x$
  - $B_y = (q/A) * I / E_y$
- Now define one single transverse brilliance as
  - $B_{\perp} = (q/A) * I / (E_x * E_y)$

# Development of Transverse UNILAC Beam Brilliance

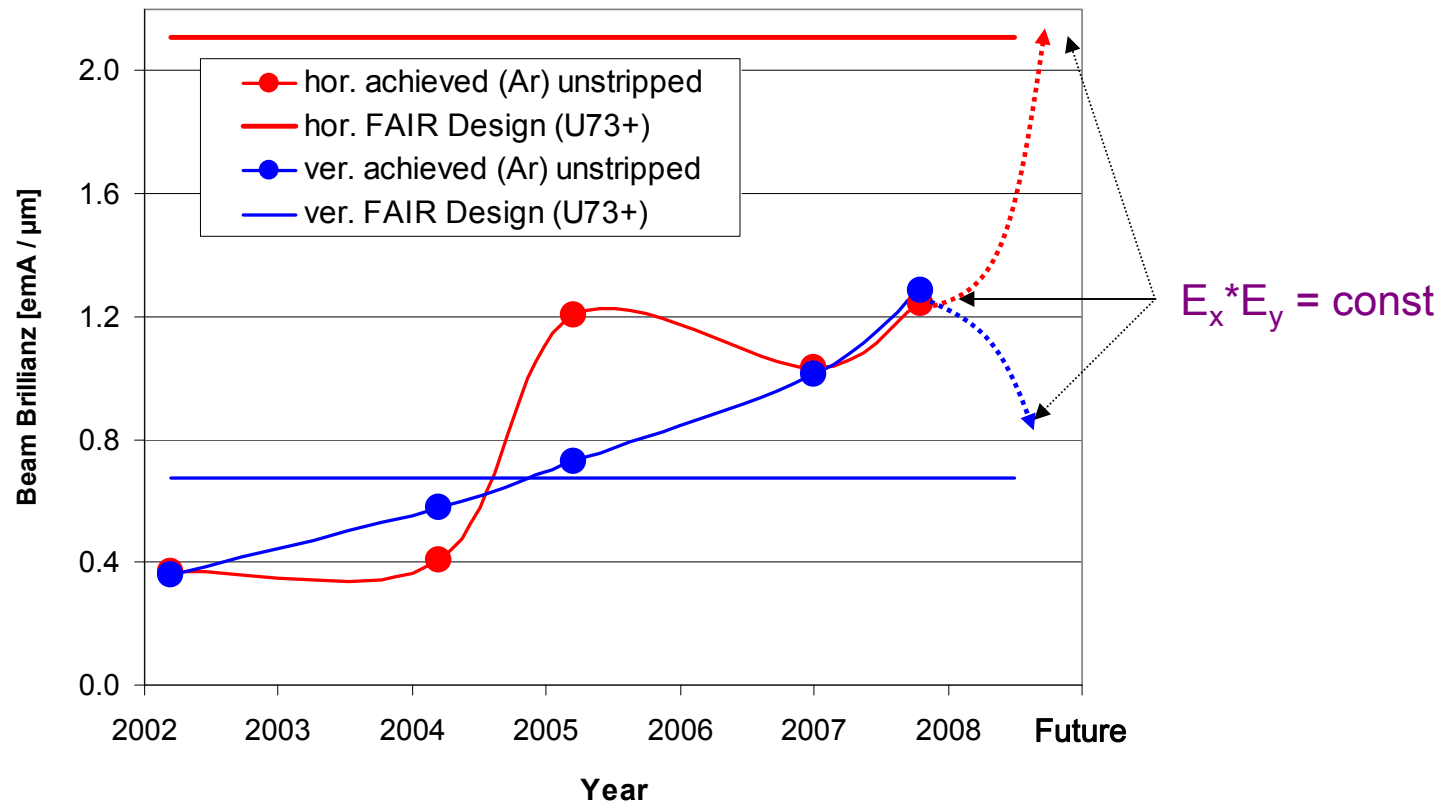

- $B_{\perp}$  ok
- $B_y$  ok
- $B_x$  not ok

# How to Meet Horizontal and Vertical Design Brilliances ?

- present UNILAC brilliances are equal
- pushing both brilliances over hor. design value : quite hard & not really required
- emittance transfer from horizontal to vertical plane should help
- transfer should preserve  $E_x * E_y$

# Conceptual Layout of an Emittance Splitter in the UNILAC

- Splitter integrated around existing Charge State Separator
- Splitter comprises :
  - coil pair ( $B \approx \text{few T}$ )
  - skew triplet + doublet or triplet
  - diagnostic box with pepper pot

stripping inside long. B-field

long. B-field couples x & y motion

# Skew Quadrupole

normal quadrupole  
no x-y coupling

skew

tilted by  $45^\circ$   
x-y coupling

# Demonstrator for Emittance Splitter in the UNILAC

## Set-up for testing:

- low current  $H_3^+ \rightarrow$  proton beam ( $B = 0.8$  T)
- no space charge
- low magnetic fields
- required equipment might be available on-site
- simulations: no losses,  $\Delta E_x = -41\%$ ,  $\Delta E_y = +142\%$

- the following tools deal with beam rms properties
- concepts hold for total emittances, beam sizes, etc...
- linear elements, to avoid emittance growth from non-linear elements

emittances defined through beam's second moments :

- $a_i, b_i$  : two coordinates of particle  $i$
- $\langle ab \rangle$ : mean of product  $a_i b_i$
- $C$  is moment matrix (symmetric)

$$C_x = \begin{bmatrix} \langle xx \rangle & \langle xx' \rangle \\ \langle x'x \rangle & \langle x'x' \rangle \end{bmatrix}, \quad E_x^2 = \det C_x$$

$$C_y = \begin{bmatrix} \langle yy \rangle & \langle yy' \rangle \\ \langle y'y \rangle & \langle y'y' \rangle \end{bmatrix}, \quad E_y^2 = \det C_y$$

assumption: x & y plane are decoupled

linearly transport from point\_1 → point\_2 through matrices :

$$\begin{bmatrix} x \\ x' \end{bmatrix}_2 = M_x \begin{bmatrix} x \\ x' \end{bmatrix}_1 \quad M_x = \begin{bmatrix} m_{11} & m_{12} \\ m_{21} & m_{22} \end{bmatrix}, \quad \det M_x = 1$$

beam moments transport by matrix equation :

$$C_{x2} = M_x C_{x1} M_x^T$$

analogue in y

If x & y plane are **decoupled** :

$$M = \begin{bmatrix} m_{11} & m_{12} & 0 & 0 \\ m_{21} & m_{22} & 0 & 0 \\ 0 & 0 & m_{33} & m_{34} \\ 0 & 0 & m_{43} & m_{44} \end{bmatrix}, \det M = \det M_x \cdot \det M_y = 1 \cdot 1 = 1$$

- $E_x$  and  $E_y$  are preserved separately
- **x-y coupling moments are zero**
- non-coupling elements: drift, dipole, quadrupole, rf-gap
- transport in x calculated w/o knowledge on beam properties in y
  
- to change  $E_x$  and/or  $E_y$ , coupling elements must be non-zero :
  - solenoids
  - tilted (skewed) quadrupoles or dipoles
  - *non-linear magnets not considered here*

if x & y plane might be coupled

→ generalization to 4d equations :

$$E_{4d}^2 = \det \begin{bmatrix} \langle xx \rangle & \langle xx' \rangle & \langle xy \rangle & \langle xy' \rangle \\ \langle x'x \rangle & \langle x'x' \rangle & \langle x'y \rangle & \langle x'y' \rangle \\ \langle yx \rangle & \langle yx' \rangle & \langle yy \rangle & \langle yy' \rangle \\ \langle y'x \rangle & \langle y'x' \rangle & \langle y'y \rangle & \langle y'y' \rangle \end{bmatrix} = \det C$$

transport of moments from 1 → 2 as usual:

$$\begin{bmatrix} x \\ x' \\ y \\ y' \end{bmatrix}_2 = \begin{bmatrix} m_{11} & m_{12} & m_{13} & m_{14} \\ m_{21} & m_{22} & m_{23} & m_{24} \\ m_{31} & m_{32} & m_{33} & m_{34} \\ m_{41} & m_{42} & m_{43} & m_{44} \end{bmatrix} \begin{bmatrix} x \\ x' \\ y \\ y' \end{bmatrix}_1, \quad \det M = 1$$

$$C_2 = M C_1 M^T$$

$$E_{4d}^2 = \det \begin{bmatrix} \langle xx \rangle & \langle xx' \rangle & \langle xy \rangle & \langle xy' \rangle \\ \langle x'x \rangle & \langle x'x' \rangle & \langle x'y \rangle & \langle x'y' \rangle \\ \langle yx \rangle & \langle yx' \rangle & \langle yy \rangle & \langle yy' \rangle \\ \langle y'x \rangle & \langle y'x' \rangle & \langle y'y \rangle & \langle y'y' \rangle \end{bmatrix} = \det C$$

- $E_{4d}$  is preserved for even solenoids, tilted dipoles & quadrupoles; all tilt angles
- These elements couple x & y plane and produce **x-y correlations**
- $E_x \cdot E_y \geq E_{4d}$
- $E_x \cdot E_y = E_{4d}$  holds just for zero x-y correlation
- although  $E_{4d}$  is preserved,  $E_x \cdot E_y$  increases if x-y correlation is produced

Transport matrix of a solenoid, length  $L$ , and field strength  $B$  :

$$M_{Solenoid} = \begin{bmatrix} C^2 & \frac{SC}{K} & SC & \frac{S^2}{K} \\ -KSC & C^2 & -KS^2 & CS \\ -SC & -\frac{S^2}{K} & C^2 & \frac{SC}{K} \\ KS^2 & -SC & -KSC & C^2 \end{bmatrix} \quad K = \frac{B}{2(B\rho)}$$
$$C = \cos(KL)$$
$$S = \sin(KL)$$

Transport matrix of a thin hor. foc. quadrupole, rotated clockwise by  $-45^\circ$ , focusing length  $1/q$  :

$$M_{SkewQuad} = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & -q & 0 \\ 0 & 0 & 1 & 0 \\ -q & 0 & 0 & 1 \end{bmatrix}$$

- drifts, gaps, tilted quads & dipoles, solenoids are "symplectic" :

$$M^T J M = J$$

$$J := \begin{bmatrix} 0 & 1 & 0 & 0 \\ -1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 \\ 0 & 0 & -1 & 0 \end{bmatrix}$$

- symplectic transformations preserve two quantities :
  - $E_{4d}^2 = \det C$
  - $\text{Trace}\{JCJC\}$

see for instance prst-ab 6 104002 (2003)

## Symplectic beam lines :

- preserve  $E_{4d}$
- change simultaneously  $E_x$  &  $E_y$  :
  - no initial x-y correlations  $\rightarrow E_x$  &  $E_y$  generally increase in x-y coupling devices
  - initial x-y correlations  $\rightarrow E_x$  &  $E_y$  might be decreased by lowering correlations
- allow swapping  $E_x \leftrightarrow E_y$

## But

- symplectic beam lines do not change the "emittance splittability" of a beam
- "regular" beams are not "splittable"
- "regular": distributions as generally used for simulations (no inter-plane coupling)
- splittability related to  $\text{Trace}\{JCJC\}$ , how ??????

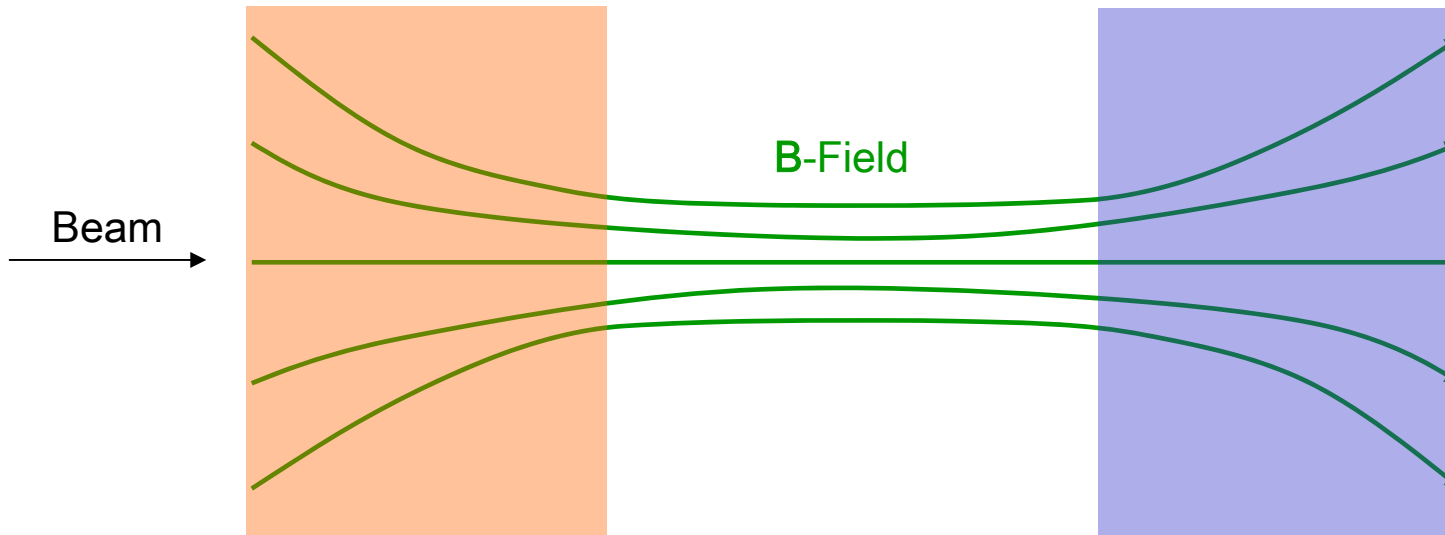

- no emittance splitting with skewed quads/dipoles or solenoids only
- to make beam splittable → apply non-symplectic action

solenoid fringe field: non-symplectic transformation, changing  $\text{Trace}\{JCJC\}$ ,  $E_{4d}$  preservation

$$M_{SolFringe} = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & +K & 0 \\ 0 & 0 & 1 & 0 \\ -K & 0 & 0 & 1 \end{bmatrix} \quad K(\text{in}) = -K(\text{out})$$

$$K = \frac{B}{2(B\rho)}$$

- transverse kick by transverse fringe
- non-symplectic transformation
- $\Delta x_i' \sim y_i, \quad \Delta y_i' \sim -x_i,$
- each particle gets angular momentum
- $L_i = \mathbf{r}_i \times \mathbf{p}_i \sim x_i y_i' - x_i' y_i$

- spiraling around **B**
- non-symplectic

- -(transverse kick) by -(transverse fringe)
- kick removes  $L_i$
- complete solenoid is symplectic again  
( follows from  $\text{div } \mathbf{B} = 0$  )

change of beam's  $B_p$  prevents kick-cancellation

- beam experiences non-symplectic transformation
- beam is "magnetized" (splittable) at solenoid exit

- Magnetized beams are splittable
- "Magnetized" and "x-y correlated" are not the same !!!
- x-y correlated beams can be magnetized or not
- Beam lines made just from solenoids, skewed quads & dipoles, drifts, gaps :
  - can change x-y correlations
  - can not change  $\text{Trace}\{JCJC\}$
  - preserve the magnetization, i.e. the "splittability"

- electron guns inside a solenoid provide magnetized beams
- e-linacs: emittance ratios of  $E_x/E_y \approx 50$  were achieved (D. Edwards, XX<sup>th</sup> LINAC Conf., Monterey)
- proposal to apply this principle to ion beams :
  - stripping inside long. magn. field
  - non-symplectic action → transverse emittance splitting possible

*remark: beams from ECRs are magnetized and can be split*

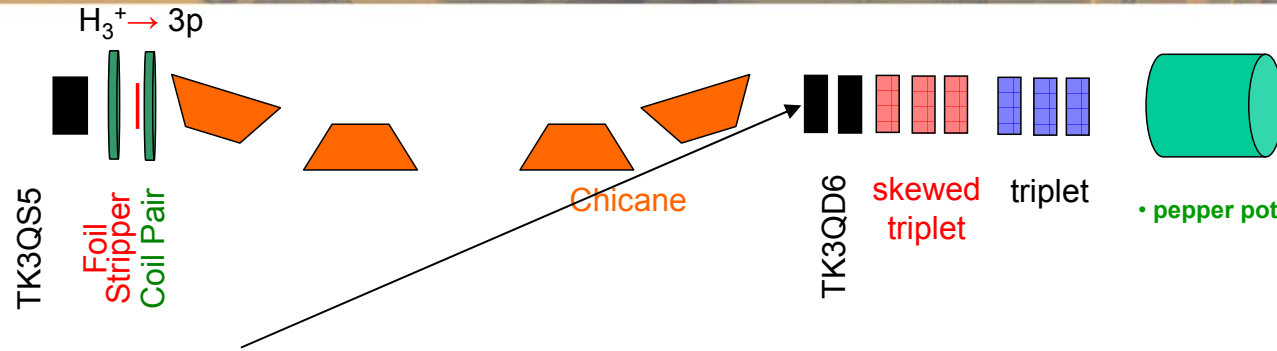

# Procedure of Emittance Splitting in the UNILAC (1)

- switch off the skew triplet and the normal triplet
- place the stripping foil inside a long. B-field (0.n T) produced by coil pair
- proton beam behind coil/foil combination :
  - magnetized, emittance splitting possible
  - inter-plane correlations, i.e.  $E_x \cdot E_y \geq E_{4d}$

# Procedure of Emittance Splitting in the UNILAC (2)

- at entrance TK3QD6: measure full 4d beam's second moment matrix  $C_1$ , i.e. 10 values

$$C_1 = \begin{bmatrix} \langle xx \rangle & \langle xx' \rangle & \langle xy \rangle & \langle xy' \rangle \\ \langle x'x \rangle & \langle x'x' \rangle & \langle x'y \rangle & \langle x'y' \rangle \\ \langle yx \rangle & \langle yx' \rangle & \langle yy \rangle & \langle yy' \rangle \\ \langle y'x \rangle & \langle y'x' \rangle & \langle y'y \rangle & \langle y'y' \rangle \end{bmatrix}_{TK3QD6_{in}}$$

C is symmetric !

- set TK3QD6 and skew triplet to provide transport of beam moments  $C_2 = M C_1 M^T$  with

$$C_2 = \begin{bmatrix} \langle xx \rangle & \langle xx' \rangle & 0 & 0 \\ \langle x'x \rangle & \langle x'x' \rangle & 0 & 0 \\ 0 & 0 & \langle yy \rangle & \langle yy' \rangle \\ 0 & 0 & \langle y'y \rangle & \langle y'y' \rangle \end{bmatrix}_{Skew_{out}}$$

and minimized  $\det \begin{bmatrix} \langle xx \rangle & \langle xx' \rangle \\ \langle x'x \rangle & \langle x'x' \rangle \end{bmatrix}_{Skew_{out}}$  at skew exit

- use last triplet to re-match envelope for further transport

# Simulations with PARMILA-Transport

## Simulations assume :

- $H_3^+$ , 11.4 MeV/u, low current, no space charge
- initial Gaussian distribution, no x-y correlations
- rms momentum spread 0.1%, (from measurements)
- rms emittance hor./ver. 1.2  $\mu\text{m}$  (from measurements)
- $B = 0.8 \text{ T}$
- angle scattering at stripper foil
- 2<sup>nd</sup> order transport in dipoles (dispersion, 6-pole fringes)
- existing aperture limits (chambers, irises, ...)

# Inside Coil Pair, i.e. on Stripping Foil

before foil scattering

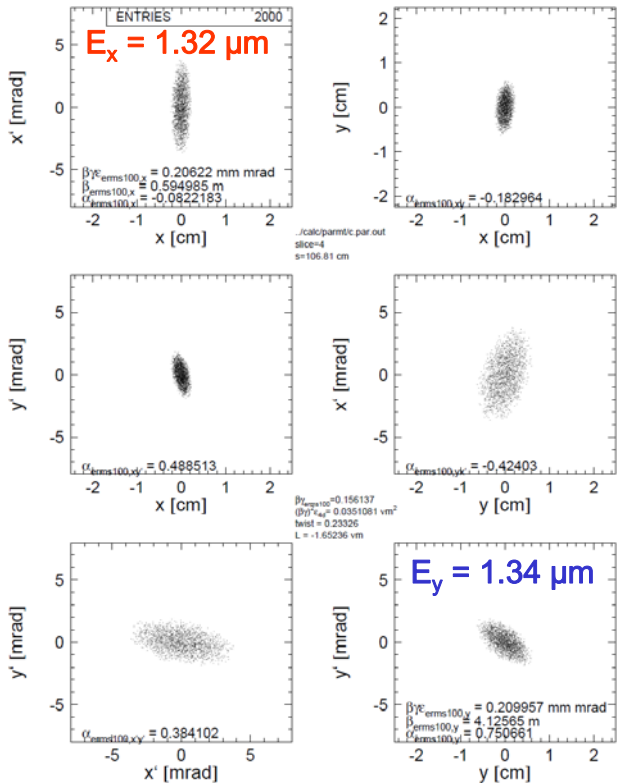

after foil scattering

long. B-field:

- x-y correlations
- $\Delta E_{4d} = 0!$
- $E_x \cdot E_y = 1.2 E_{4d}$
- $\Delta E_x, \Delta E_y$

Foil Scattering:

- $\Delta E_{4d} = 38\%$
- $\Delta E_x, \Delta E_y$

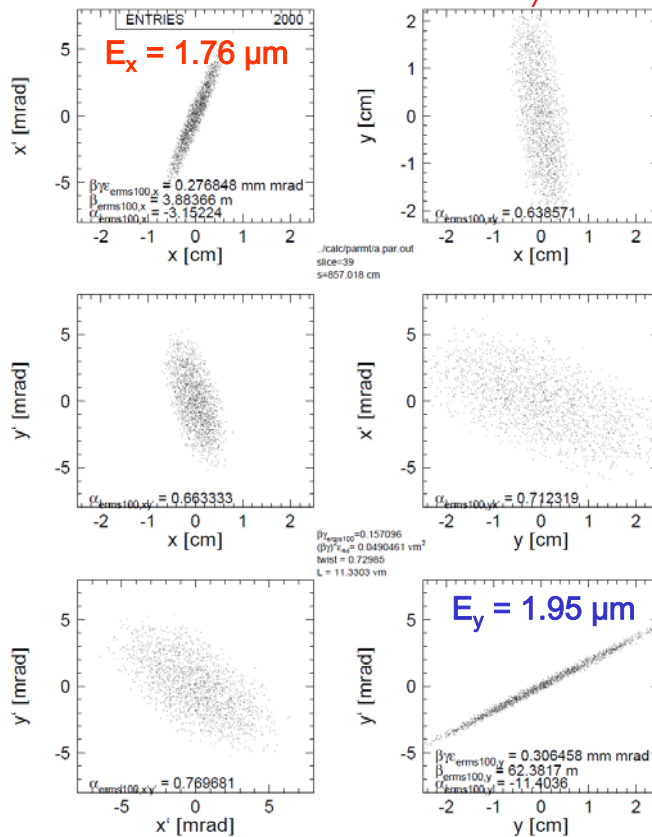

# Exit of Coil Pair

- inter-plane correlations
- $E_x \cdot E_y = 1.7 E_{4d}$
- $\Delta E_x, \Delta E_y$

beam is magnetized

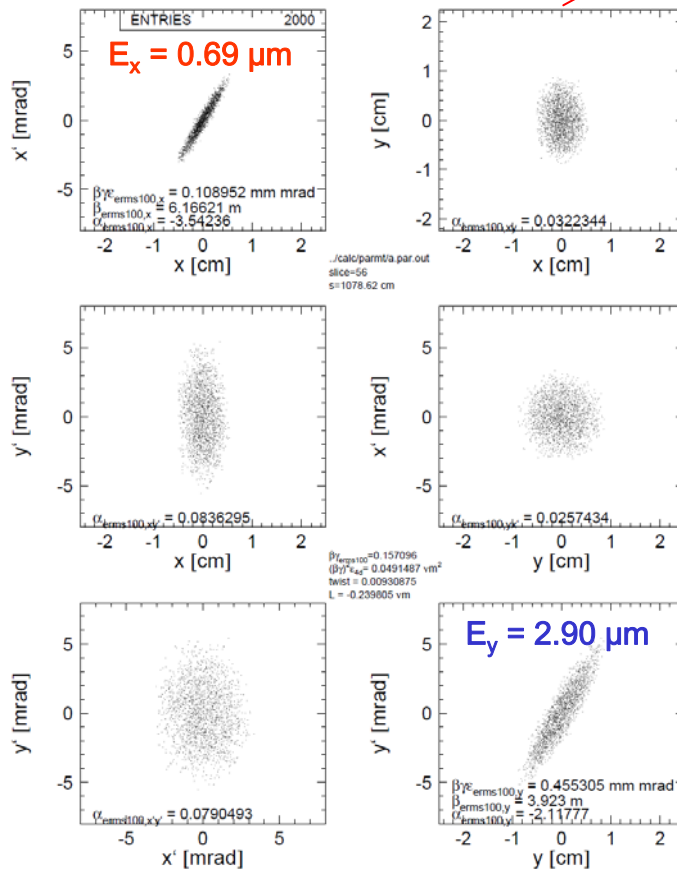

# Entrance to TK3QD6

- inter-plane correlations
- $E_x \cdot E_y = 1.7 E_{4d}$
- evaluation of beam moment matrix
- setting TK3QD6 and skew triplet ...

beam is magnetized

# Entrance to First Normal Quadrupole

- x-y correlations almost fully removed
- $E_x \cdot E_y = 1.01 E_{4d}$
- $E_x / E_y = 0.24$

beam is magnetized

!! splitting did not remove magnetization !!

# Comparison: Before/After Section

entrance ( $H_3^+$ ):

exit (p):

Balance:

- Transmission: 100 %
- $\Delta E_x$ : - 41 %
- $\Delta E_y$ : +142 %
- $\Delta E_{4d}$ : + 42 %
- magnetized !

# Experimental Set-up for Proof of Principles

built a set-up for experimental demonstration of simulated case ( $H_3^+ \rightarrow 3p$ ) :

- Coil pair :

- $B_o = 0.77 \text{ T}$
- $L_{\text{eff}} = 40 \text{ cm}$ ; i.e.  $R_{\text{Coil}} = 29 \text{ cm}$

- 6 "Bokemeier" Coils
- $R_{\text{Coil}} \approx 28 \text{ cm}$
- $A_{\text{conductor}} \approx 50 \text{ cm}^2$
- $L_{\text{yoke}} \approx 4.75 \text{ cm}$
- $B_{\text{max}}$  to be measured

- 2 Triplets :

- $R_{\text{app}} \geq 40 \text{ mm}$
- $B' \cdot L_{\text{eff}} \geq 3 \text{ T}$

- 2 "Injection Triplets"
- $R_{\text{ap}} \approx 40 \text{ mm}$
- $L_{\text{eff}} \approx 20/40/20 \text{ cm}$
- $B'_{\text{max}} \approx 15 \text{ T/m}$

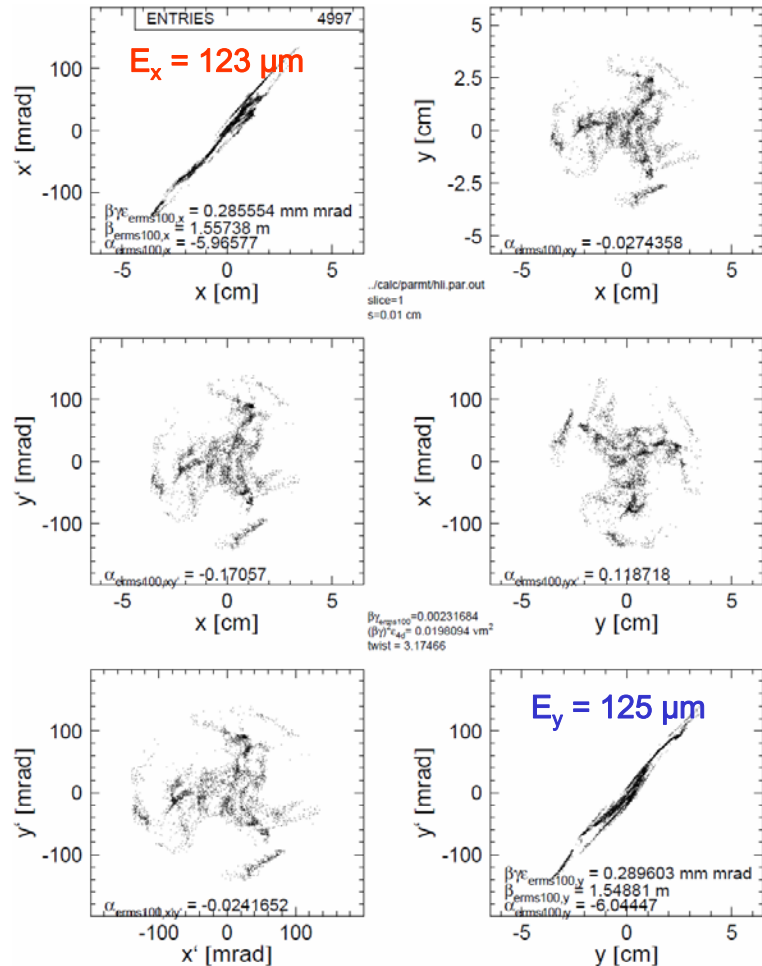

- 1 Triplet "E-12\_156"
- $R_{\text{ap}} \approx 50 \text{ mm}$
- $L_{\text{eff}} \approx 35/60/40 \text{ cm}$
- $B'_{\text{max}}$  to be measured

- Pepper pot device  $\rightarrow$  improvements, but further testing required

## beam after extraction from ECR

courtesy P. Spädtke

confining in long. B-field:

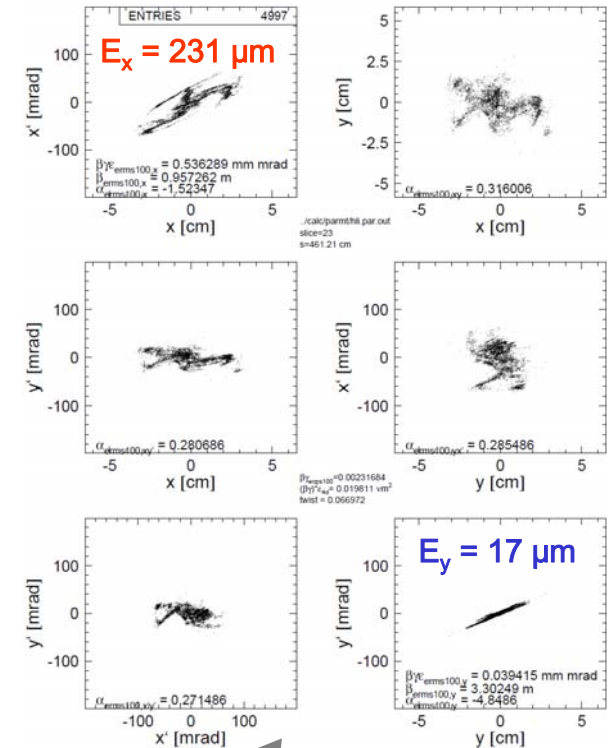

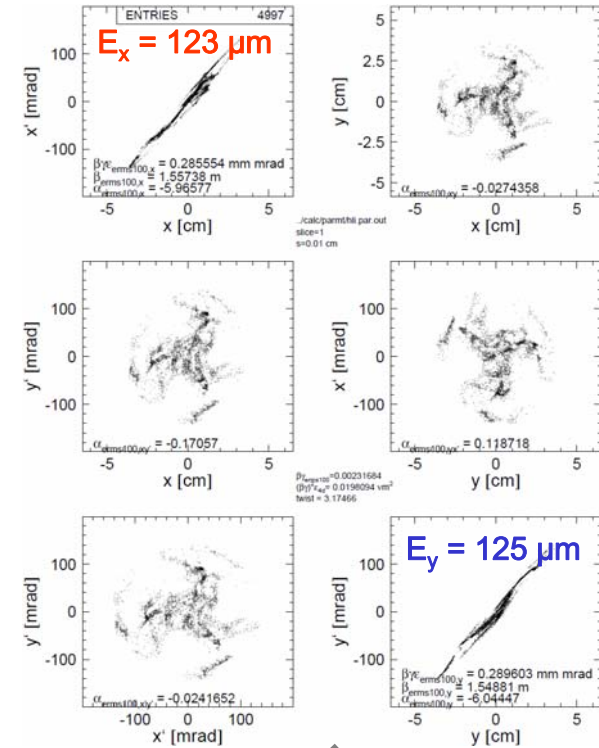

- ECR-extracted beam has x-y correlations
- $E_x = E_y$
- $E_x \cdot E_y = 4.2 E_{4d} \geq E_{4d}$  (from correlations)
- ECR-extracted beam is **magnetized**
- beam is "emittance splittable"

# Emittance Splitting of an ECR Beam

directly after ECR extraction

after emittance splitter

## ECR-LEBT Emittance Splitter

- $E_x = 123 \mu\text{m}$
- $E_y = 125 \mu\text{m}$
- $E_x \cdot E_y = 4.2 E_{4d}$

- $E_x = 231 \mu\text{m}$
- $E_y = 17 \mu\text{m}$
- $E_x \cdot E_y = 1.1 E_{4d}$
- $E_x \cdot E_y$  red. by factor 4 !!

# Emittance Splitting of an ECR Beam

- ECR beams are used at therapy accelerator facilities
- split emittance beams could be injected into the synchrotron
- split emittances will increase MTI efficiency

- Emittance splitting might improve synchrotron injection efficiency without :
  - primary beam current increase
  - beam collimation
- Method requires long. B-field along stripper and 3 skewed quads
- Simulations (low current, light ions): hor. emitt. reduction by  $n \cdot 10\%$  possible
- Experimental proof of principle using  $H_3^+ \rightarrow 3p$  along UNILAC proposed
- Additional application  $\rightarrow$  ECR beams (no stripper required)
  
- *Might be applicable also along mod. HSI-Alvarez section ( $U^{4+} \rightarrow U^{37+}$ ) :*
  - *lower B-field ( $\approx 2 T$ ) w.r.t. stripping  $U^{27+} \rightarrow U^{73+}$  at 11.4 MeV/u*
  - *simulations needed:*
    - *does split beam survive transport to SIS ?*
    - *what beam is really required at SIS injection ( $I, q, E_x, E_y, \Delta T_{pulse}$ ) ?*
